

Labor / Cut Management LCM

Labor / Cut Management (LCM) is part of Byte's shop floor control family of products. LCM manages the operation, style and cut information and prints bundle tickets for part identification. LCM has the functionality built in to handle single plant configurations as well as central cutting / remote sewing sites. LCM has the ability to print bar-coded bundle tickets which will allow your company to expand into work-in-process tracking and source to gross incentive payroll.

Benefits

- **Efficiently manage Rates & Styles:** LCM allows users to manage their operation & style databases. Its built-in processes handle updates to base rates, standard allowed minutes or rates at the style & the cut levels.
- **Flexibility in multiple style Routings:** LCM allows users to set-up individual labor routings by style so that if equipment, base rates or methods change by plant or contractor, style routings can be set-up for each specific situation.
- **Flexible Bundle Ticket Formats:** LCM provides 5 standard bundle ticket formats. It also has the added flexibility to customize bundle ticket formats to meet your exact needs. If part identification is the main need, LCM can be configured to only print text without the barcode.
- **Verify bundles in a cut:** LCM provides a bundle check-off list to match bundles coming off the spreading table to the printed bundle tickets to make matching cut parts to bundles much easier.

Flexible Configurations & Features

LCM is available in various configurations to blend with the way *you* manufacture:

- **LCM:** The stand-alone or network version of LCM is primarily installed when cutting and sewing are housed under the same roof.
- **Central Cutting:** An option used when you have one or more cutting facilities that cut for one or more sewing facilities. All cuts will be created centrally (and possibly printed) and routed to the individual sewing facilities. Each of the external sewing facilities will have their own BYTE software to receive the cut data from the cutting facility.
- **Remote Sewing:** This option is used at the external sewing facility, in conjunction with the Central Cutting facility, to receive the cut data. This option scales the remote sewing system down and does not allow the creation of cuts remotely. Cuts can enter the remote sewing system from the cutting facility only.
- **Cut History:** New for 2008, Byte has added the Cut History program to store historical cut information once the actual cut and bundles have been removed from the database. Cut History keeps track of total SAH's, completed SAH's, Cut Quantity, & Completed Quantity by Cut.
